

Kforce Global Solutions

Capability Statement

Web Development & Support

Business Challenges

An increasing focus on emerging web technologies such as WEB 2.0 provides the opportunity to leverage benefits from adopting the new capabilities available to the business as well as integrating them with legacy systems. Often the expertise to design, develop, test, and roll out new web-enabled business tools doesn't exist in-house and can be difficult or costly to develop.

Kforce Global Solution

Global offers services in all areas of web development, including internal and public-facing web site development and maintenance. We have an established Center of Excellence for Web Development and Support with four major technology skill sets:

- **SharePoint™** – Web-Based Collaboration Services
- **Microsoft® .NET** – Development Environment
- **JAVA™** – Portable Flexible Programming
- **Adobe Flex™** – Framework for open source web applications

Global's experienced team is ready to support your business goals, ensuring strict adherence to quality assurance processes and web-aligned SDM's such as Agile. Our solutions are tailored for each client's specific needs and span across the entire software development lifecycle – from planning and business case development, to design, architecture, and requirements definition, to coding, testing, and release, and finally to ongoing support.

Global is well positioned to rapidly supply or augment client capabilities with experienced, cost effective resources. We can utilize resources from our Philippine delivery centers in combination with onsite client or Global resources.

Value & Results

Global has a history of creatively applying technology to meet our clients' specific needs. Examples of how our core Web technology skills can align to business needs include:

- **SharePoint™** – Global has worked with many clients to deliver solutions with SharePoint in document management, portal, collaboration, MOSS implementation and customization, enterprise search, and document workflow.
- **.NET** – Global currently delivers solutions in .NET ranging from enterprise-wide web applications to more complex, niche solutions, including winforms, web services, and SOA implementations.
- **JAVA™** – Global has an active practice currently using Java for our clients involving enterprise-class public and private websites; development is generally done within a framework such as Hibernate or Spring.
- **Adobe Flex™** – Global has an extensive track record developing solutions for clients using Adobe Flex to create complex high-volume commercial websites with many interfaces to partners.
